

## **Lightsense Ageless:**

**1. Do I need to replace the LEDs at some point in the future?** Lightsense LED Light Therapy devices are designed to last a lifetime if you follow the instructions in the User Manual.

**2. Do the Infrared LEDs look like they are not working?** Yes, they will appear to not be lit because they aren't visible to the human eye.

**3. Can I apply any skincare products prior to using my light?** You can apply most anti-aging serums and moisturizers, although skincare ingredients that can cause dryness like Retin-A or benzoyl peroxide should not be used prior to an LED treatment, and instead can be applied any time after the treatment. You can also use your light without first applying a skincare product, although in this case you should apply a moisturizer after using your light.

**4. Can the weather/humidity cause results to take longer than normal?** Yes. If you are in region where the humidity gets very low in the winter or summer time and the air is extremely dry, then you should apply more serum or moisturizer than you normally would, either just before or just after using your light.

**4. Do I have to touch the skin and hold it still for the device to work?** Yes, LEDs are most effective when held gently touching the skin in one place.

**5. Does Lightsense work on everyone?** Yes, this is science. Some people will take a little longer than others and a few people may see results in a bit less time, but for the most part if you've followed the instructions and taken "before and after" pictures you should start to see results within 8 weeks.

**6. Are the results lasting?** Yes, the clinical studies demonstrated that the results were lasting when used continuously. Once you have achieved your desired results, you can reduce your treatment time to twice a week for maintenance.
